

# Institutional conversion to energy-efficient ultra-low freezers decreases carbon footprint and reduces energy costs: Methods and Results

Dean Shehu

Strategic Sourcing, Research

University of California, San Francisco

# Overview

- Problem
- Pilot Project
- Campus-wide Program
- UCSF Tools for Other Institutions

# UCSF's -80C fleet

## Problem Statement

- UCSF operates over 1,250 -80°C freezers.
- 95% were older energy-inefficient models using triple the electricity of newer ENERGY STAR-certified freezers
- **~\$2.3 million per year in excess energy costs**
  - 3,423 metric tons of CO2
  - the annual electricity use of 676 homes

## Pilot Project: Is it possible?

- **Funding:** \$750,000 to replace the 43 most inefficient freezers in one building at no cost to owners
- **Consolidation:** could we remove more freezers than we add?
- **Logistics:** Higher rate of large equipment movement while keeping samples cold

# Step 1: Forecasting Energy Use

**Institutional impact is the sum of the energy use of every freezer.**

## The institutional impact factors

- Freezer plug draw + HVAC electrical use
- HVAC impact is climate-dependent. For San Francisco, we added 12% to freezer energy use
- Aging. Units use more energy and emit more heat as they age

$$\text{Energy Impact} = \sum_{t=1}^n \left( \underbrace{\text{Freezer Energy Use} \times \text{HVAC Impact Factor}}_{\text{Current Energy Impact}} \times \underbrace{\text{Energy Efficiency Decline}^{\text{Future Year } n}}_{\text{Aging: Future Energy Impact}} \right)_n$$

## Variables

**Freezer energy use:** Total annual energy use for any number of freezers in kWh

**HVAC impact factor:** 1 + the percentage increase in HVAC electrical usage

**Energy efficiency decline:** 1.03 (1 + 3%) ← **Based on well-maintained units; therefore conservative**

# Step 2: Forecasting Energy Costs

## The business case for funding

**An accurate business case must account for rising electrical rates to avoid understating the project benefits**

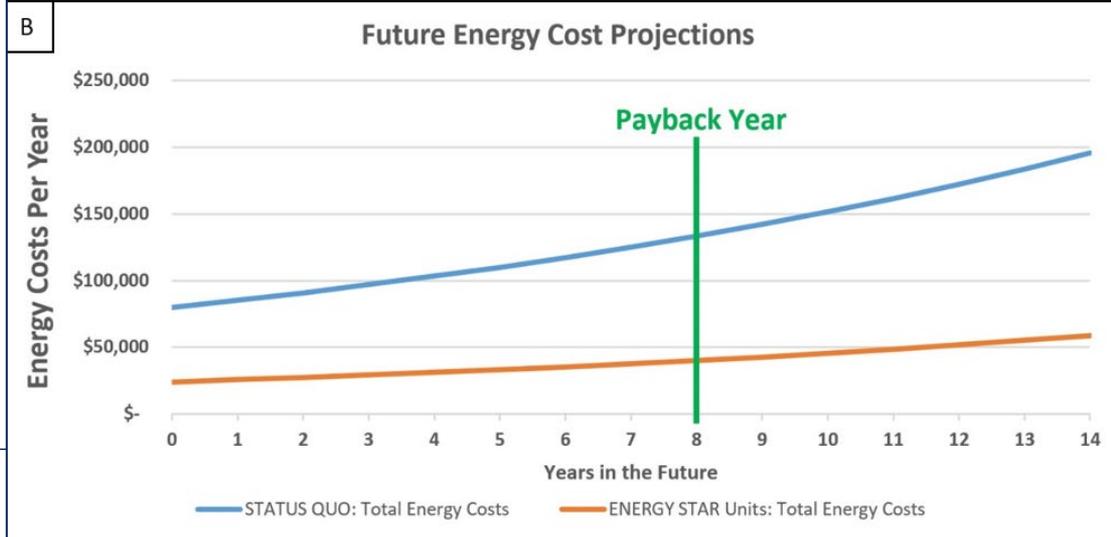

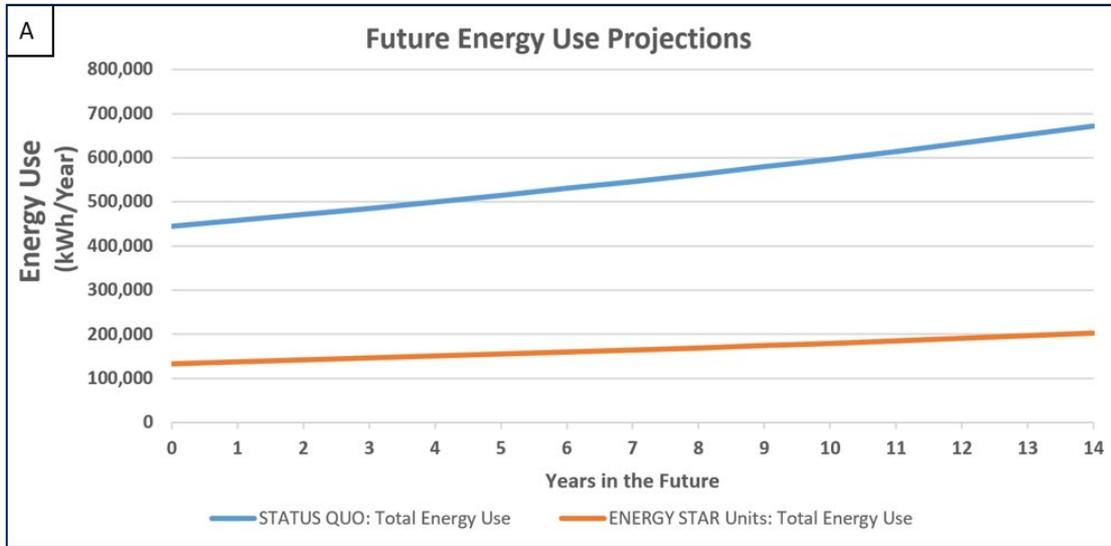

**Energy Costs<sub>Year n</sub> = (Electrical Burden<sub>Year n</sub>) x (Future Electricity Rate<sub>Year n</sub>)**

**Future Electricity Rate<sub>Year n</sub> = Current Electrical Rate x ((1 + Annual Rate Increase)<sup>Future Year n</sup>)**

# Results Energy and Cost Forecasts

**An accurate business case accounts for rising energy use (aging) + energy rates**

- Diverging curves result from different starting values for energy use & costs which are compounded by annual aging rate and electricity rates.
- 3% aging is conservative

# Step 3: Identify the most inefficient freezers

## Model to predict energy use

- Based on energy use measurements on 34 freezers.

## Benefits

- **Saves time:** Requires only storage volume and age info, versus 10 years to identify the most inefficient freezers through measuring energy use.
- **Reduces risk:** Avoids freezer failures from unplugging old units to install a meter.
- **Accuracy:** 7.5% mean absolute percentage error (MAPE) predicted vs actual energy use

$$\text{Energy Use} = 1.6569 - (0.4006 * \text{Energy Star}) - (0.0333 * \text{Volume}) + (0.0168 * \text{Age})$$

(kWh/cubic foot/day)

## Variables

**ENERGY STAR:** Yes = 1, No = 0

**Storage Volume:** in cubic feet

**Age:** In years

Freezers n = 34	R-sq. = 0.6862	
	Coefficient	p-value
Intercept	1.6569	0.0000
ENERGY STAR certification	-0.4006	0.0078
Storage Volume	-0.0333	0.0051
Age	0.0168	0.0230

# Pilot Results

## Outcome

- 43 removed 41 installed. (2 labs consolidated)
  - 134 metric tons CO2 eliminated
  - Or the annual electricity use of 26.4 homes
- Project costs: \$679,837
- 8-year payback period (conservative)

## Other benefits

- Average of 7.2 cubic feet storage volume gained for the same footprint
- Average age of replaced units was 17.5 years (at 10 years, compressors working almost constantly)
- 35% of the replaced units exhibited symptoms of decline

**Project approved for campus-wide implementation with \$3M funding**

# Institutional Scale Replacement

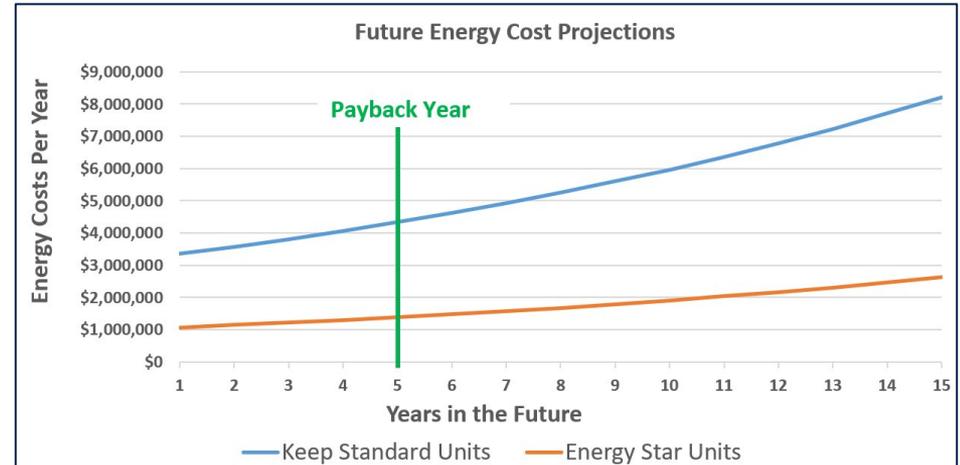

**Goal:** Accelerate UCSF's transition to 100% Energy Star -80C freezers

## Project Goals

- **Prevent standard freezer purchases**
  - Orders for standard units sent back to departments.
- **Replace 300 most inefficient freezers**
  - \$3 million in funding from UCSF
  - \$10,000 Rebate per replacement
- **Split Rebate.** To incentivize consolidation
  - \$4,000 for purchasing ENERGY STAR
  - \$6,000 for recycling standard freezer

## Results

- **204 units replaced**
- **13 units removed through consolidation**

# Policy Compliance

## Procurement Team Authority, References and Tools

- Buyers are vested with the authority to return requisitions for non-ENERGY STAR freezers.

### Process Reference

#### Summary

UCSF has committed to reducing carbon emissions that contribute to climate change and their concomitant impact on global health. UCSF is striving to achieve carbon neutrality by 2025, including a 2% annual energy usage reduction. In our effort to achieve these goals, UCSF has policy to purchase ENERGY STAR-certified products when those options are available.

Negative 80°Celsius freezers are one of the most energy-intensive equipment on our campus. Older freezers use as much energy as a 3-bedroom home; however, ENERGY STAR-certified freezers use 2/3 less electricity. The Chancellor, and cabinet, are committed to completely transitioning UCSF to ENERGY STAR negative 80°Celsius freezers.

**UCSF leadership has vested SCM Buyers with the authority to convert orders for non-ENERGY STAR freezers to ENERGY STAR negative 80°Celsius freezers.**

#### Process to Review Requisitions for ENERGY STAR Negative 80°Celsius Freezers

- Buyer receives an order for a freezer in their que.
- Is this an Ultra-low temperature freezer (aka -80 Celsius freezer)?
- Is the unit certified as ENERGY STAR?
  - Enter the unit model number in the search box on the Energy Star web site for [Energy Star certified ULT freezers models](#). NOTE: if model is not on this [page](#), it is not officially an Energy Star certified model!

- If Buyer is unsure if the model number is listed correctly on the requisition (e.g. it resembles a format on the Energy Star web site) please contact Dean Shehu.
- If the search pulls up the model, **approve the order**.
  - If the search does not pull up the model: 'Return' the requisition
    - Send an email and/or requisition note to the requestor (Can use text file: [Procurement Restrictions Email Template for SCM Buyers Use](#))
    - Attach the pdf of the signed letter UCSF Energy Star Policy Letter (signed by Vice Chancellor of Research)
  - Once the requisition is updated follow steps in step 3 to confirm the new unit is in fact ENERGY STAR certified. If yes then **approve the order**.
  - If not then contact Strategic Sourcing Manager for Research (Dean Shehu) to discuss the order with the customer. Dean will discuss with lab who will update order and send to Buyer one last time.

### Letter Signed by Vice Chancellor of Research

Dear Colleague,

UCSF has committed to conserve energy and reduce greenhouse gas (GHG) emissions and their concomitant impact on global health. UC policy has set targets to achieve at least a 90% reduction in total emissions by no later than 2045 and a 2% reduction in annual energy usage. In our effort to achieve these goals, UCSF has a [policy to purchase Energy Star-certified products](#) when those options are available.

The -80C lab freezer you have selected to purchase is not Energy Star-certified. The U.S. Department of Energy's web site shows all current models of [Energy Star -80C freezers](#). Please select a ULT freezer from this list.

UCSF has a goal to decrease the number of older -80C ULT freezers which use as much energy as a 3-bedroom home. Energy Star-certified ULT freezers use a third of the electricity compared to older non-Energy Star ULT freezers.

We appreciate your understanding and support in making an environmentally conscious purchase decision to help protect our planet. UCSF has a **ULT Freezer Rebate Program** which is designed to mitigate the typical cost difference between Energy Star-certified and non-certified -80C freezers. The Program offers a rebate when buying a new ULT freezer. For more information, go to [UCSF ULT Freezer Rebate Program](#).

For questions regarding Energy Star -80C freezer rebates, please contact UCSF Sustainability: [sustainability@ucsf.edu](mailto:sustainability@ucsf.edu). If an Energy Star model does not meet your laboratory's specific requirements, please speak with Sustainability about next steps.

Respectfully,

Harold R. Collard  
Vice Chancellor for Research

### Email Language

#### Procurement Restrictions Email Template

Dear [Requestion Requestor Name],

The -80C lab freezer you have selected to purchase is not Energy Star-certified. To be in compliance with UCSF's Energy Conservation policy (please refer to attached letter from UCSF's Vice Chancellor of Research).

Please refer to the U.S. Department of Energy's web site to select from one of many models of [Energy Star -80C freezers](#).

Best regards,

UCSF Buyer Name
